

Project 25 Document Suite

Reference

P25DSR

July 23, 2008

Publication Notice

Abstract

This document tracks the current state of Project 25 standards documents. The Telecommunications Industry Association (TIA) TR8 Committee meets quarterly to develop, revise, and approve Project 25 standards documents. This document is updated soon after each TR8 Committee meeting to reflect Project 25 standards document progress.

Disclaimer

This document is sponsored by the National Institute of Standards and Technology/Office of Law Enforcement Standards (NIST/OLES). It is maintained by editors at the Institute for Telecommunication Sciences (ITS) who regularly update the document from comments by users, manufacturers, and participants in the P25 standardization process. This is not an Association of Public-Safety Communications Officials (APCO) Project 25 document.

Change Log

Date	Changes
October 2005	Initial document.
February 2006	Revised the document's heading hierarchy.
March 2006	Expanded document lists and decision chart graphics.
May 2006	Updated document lists and modified decision chart graphics. Removed the Project 25 Standards Classification Index tables as it was decided they added little value.
June 2006	Updated document lists and modified decision chart graphics.
October 2006	Updated document nomenclature and status.
April 2007	Following Oct 2006 Minneapolis meeting decisions, used the TR8 version of this document to create this agreed upon unified version, which includes estimated dates for unfinished documents. Added suggested "Note" to section 3 (page 7) clarifying that dates for unfinished documents are best-estimate targets. Removed yellow-highlighting from documents approved in April, and changed status to "Approved Apr 2007."

Date	Changes
August 2007	Following Apr 2007 Dallas and Aug 2007 Baltimore TR8 meetings, addressed earlier comments regarding document dates and publications reference organization. Updated document lists and publication dates.
October 2007	Removed version numbering for this document in favor of using only a revision date. Highlighted P25 document requirement levels. Added a new section introducing P25 interfaces. Edited section 1 and 3. Added “Project 25 Communications Resources” section. Added Disclaimer and Contact Information. Revised ISSI scope organization. Incorporated document updates.
December 2007	Corrected estimated dates for ISSI Scope 1 and 2 in Table 7 and 8 respectively. Changed “Performance Measurement Methods” headings to “Measurement Methods” throughout. Changed CSSI TG to CITG, and FSSI TG to FSITG throughout. Added link to P25 Statement of Requirements. Added in-progress ISSI Scope 2 compliance assessment standards.
April 2008	Updated document lists and publication dates.
May 2008	Updated document lists and publication dates following San Diego TR8 meetings.
July 2008	Organized the Console Subsystem section into Conventional (Section 4.4.1) and Trunking (Section 4.4.2) subsections, and reflected this change in the Project 25 Console decision chart (Section 7.4).

1 Project 25 Document Suite

1.1 Introduction

Project 25 (P25) is a partnership between the public safety communications community and industry manufacturers whose goal is the publication of a suite of standards that enable the offering, procurement, and operation of interoperable digital two-way wireless communications products and systems that meet mission-critical needs of public safety practitioners. (Section 1.5 provides links to more information.)

The formal standards development process is conducted by the Mobile and Personal Private Radio Standards Committee (TIA TR-8) of the Telecommunications Industry Association's (TIA) Standards and Technology Department. TIA is accredited by the American National Standards Institute (ANSI) to develop voluntary industry standards for a wide variety of telecommunications products.

Project 25 is unique in that it is a user-driven process to develop a family of public safety communications standards for which the requirements have been defined by state, local and federal government users.

1.1.1 User Representative Steering Committee

Project 25 is directed by a steering committee composed of user representatives from federal agencies, state governments, and local governments. All activities of the P 25 process must be approved by the steering committee and TIA in accordance with the Memorandum of Understanding (MoU) consummated in 1993. Members of the public safety community attend regular meetings of the APCO Project 25 Interface Committee (APIC), which was established under the MoU to facilitate TIA's development standards that can be adopted as part of the P25 standards suite.

1.1.2 Digital Modulation and Spectrum Efficiency Two-Phase Plan

Project 25 represents the public safety community's overall strategy to develop a digital modulation solution and achieve Federal Communications Commission (FCC) spectrum efficiency mandates calling for eventual migration to narrowband channel spacing in the VHF and UHF bands, which call for an eventual four-to-one reduction in spacing from 25 kHz to 6.25 kHz equivalent per voice channel.

Project 25 addresses the FCC's mandate with a two-phase plan.

- Phase 1 defines the necessary technologies to provide for channel reduction from 25 kHz to 12.5 kHz. Phase 1 refers to P25 requirements and standards for a digital common air interface (CAI) based on frequency division multiple access (FDMA) using a 12.5 kHz channel.
- Phase 2 defines an additional 50 percent reduction in channel size to 6.25 kHz or equivalency. Phase 2 refers to P25 requirements and standards for a digital CAI time division multiple access (TDMA) using a 6.25 kHz equivalent channel, two slots in a 12.5 kHz channel.

1.1.3 Requirements Driven

P25 standards are driven by a public safety user-defined *Statement of Requirements* and an over-all approach to the development of the standards via a *Project 25 System Description and Organization* document. The organization of the standards divides the suite into documents relating to P25 system interfaces, services, and equipment. Associated with each interface, service, and equipment section is a set of documents that does either of the following:

- Describe and specify the standards appropriate to the section.
- Describe tests to demonstrate compliance of the offered interface, service, and equipment to the standards.

1.2 Description and Specification Documents

Two types of documents are used to describe and specify the interface, service, or equipment: one type provides an overview, the other type defines the protocols.

- The Overview document describes the operation and functions associated with a standard, but it does not prescribe a standard. Thus, the overview document is considered *informative*. The overview document provides background relating to the *Project 25 Statement of Requirements*, shows its relationship to the overall P25 system model, and provides guidance to users, system designers, and manufacturers.
- The Protocol documents are considered *normative*. They provide the required messages, formats, and specifications necessary for the P25 interfaces, services, and equipment to be interoperable and meet the users' *Project 25 Statement of Requirements*.

1.3 Compliance Assessment Documents

To demonstrate compliance with the protocol specifications, a set of test documents is defined.

- The Conformance Tests Procedures documents test for conformance to the protocol specifications. This document would typically be used by the manufacturer to test the system component or service for assurance of conformance to the associated protocol documents.
- The Measurements Methods documents and Performance Recommendations documents quantify service setup times, throughput delay times, bandwidths, co- and adjacent channel factors, etc. for a system component or service to ensure that the radio systems:
 - Conform to radio and network regulations
 - Behave as good neighbors to the systems of nearby agencies
 - Satisfy user performance requirements
- The Interoperability Test Procedures documents describe tests for operational equipment to assure users that equipment supplied by different manufacturers can indeed be trusted to interoperate under the conditions defined by the standards.

1.4 Standards Completion

For most cases, a P25 interface, service, or equipment standard is not complete until all documents that provide the Overview, the Protocol Specifications, the Protocol Conformance Test Procedures, the Performance Measurements Methods, the Performance Recommendations, and the Interoperability Test Procedures are published or are approved for publication by the appropriate TIA TR8.n committee.

However, because constant change is the nature of technology, standards are, in truth, never complete. Standards development is in fact, a living process. This is a practical result since there will be design improvements in the protocols, which will require changes to the protocol specifications (sometimes after products are developed or implemented). Similarly, the development of new technologies or the enactment of new regulations will cause users to modify their requirements, which results in new specification and testing standards. Thus, P25 standards will not remain fixed but will evolve with time and circumstances.

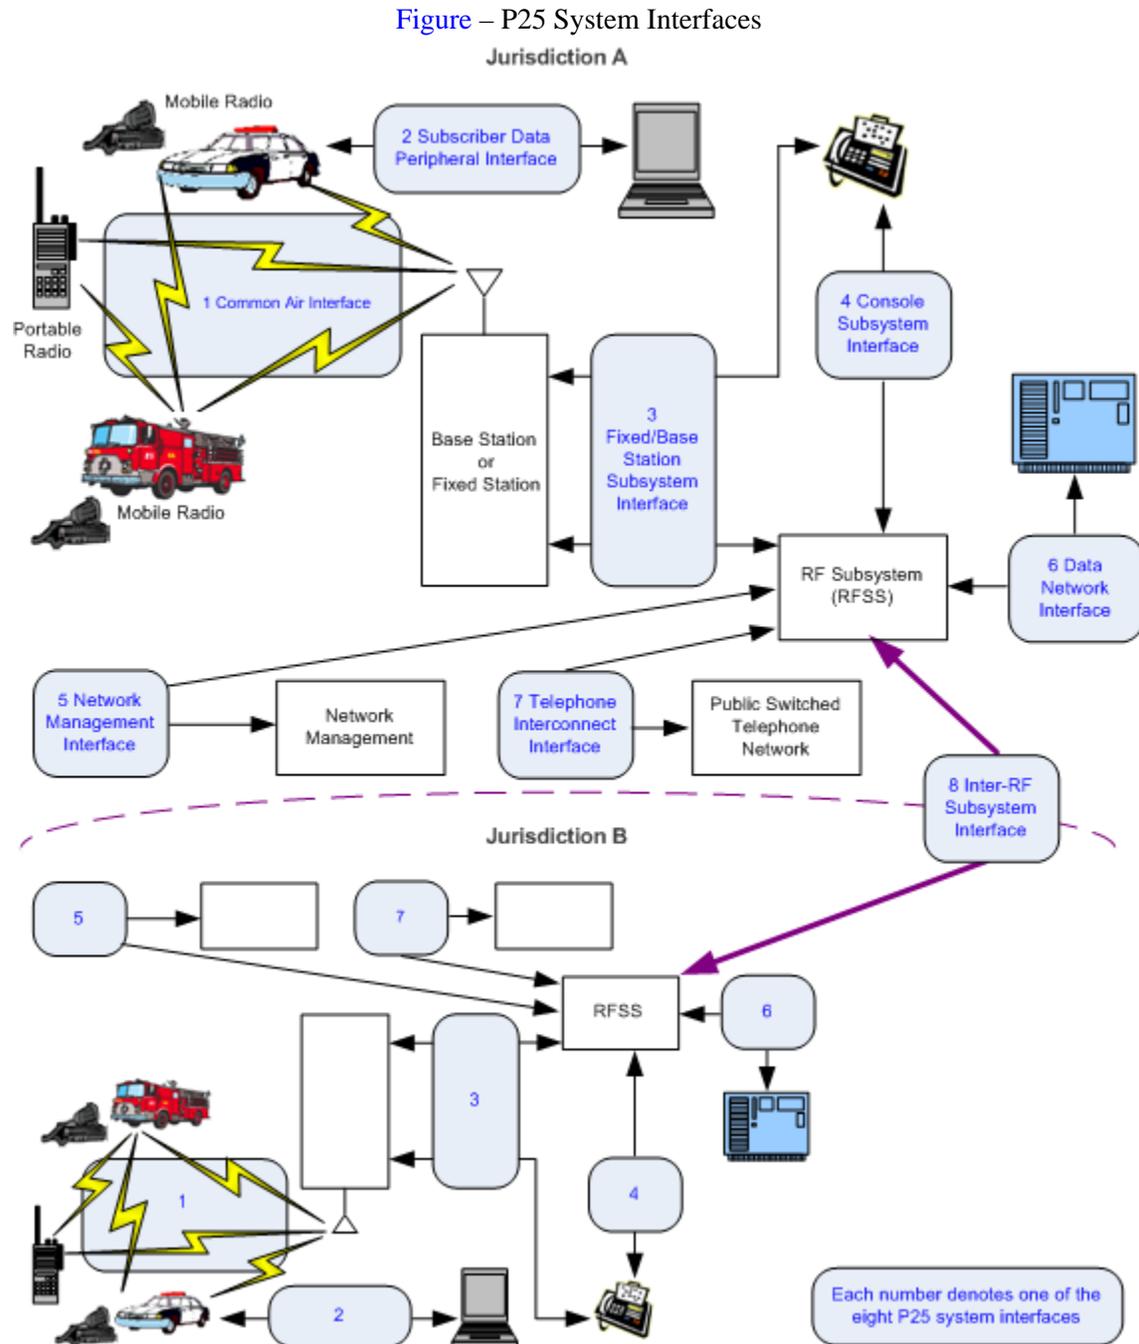

1.5 Project 25 Communications Resources

Many resources are available for learning more about Project 25, public safety communications interoperability, and how to procure a P25 system. Following are just a few places to start:

- Project 25
 - http://www.tiaonline.org/standards/technology/project_25/
 - <http://www.project25.org/>
- Public safety communications interoperability
 - <http://www.safecomprogram.gov/SAFECOM/interoperability/default.htm>
- Procurement
 - <http://www.safecomprogram.gov/SAFECOM/library/grant/>
 - <http://www.safecomprogram.gov/NR/rdonlyres/6AC5602E-7D8B-4416-9416-45F8ED257079/0/GuidelinesforRFPDevelopmentCW62806.pdf>

2 Project 25 Interfaces and Legend for Standards

The following figure identifies the eight P25 system interfaces. [Section 2.1](#) describes each interface.

P25 interfaces enable interoperable voice and data communications between and among different public safety agencies. An example is communications between police and firefighters in a particular jurisdiction. A further example is communications among agencies in different jurisdictions, such as when incidents require the response of agencies from two or more jurisdictions. Standardized P25 interfaces are the “glue”

enabling interoperable mission-critical communications between and among radios and infrastructure equipment procured from different manufacturers that compose public safety P25 land mobile radio (LMR) networks.

2.1 Interfaces Described

Dividing the LMR network at defined interfaces lets manufacturers develop interoperable products specific to their areas of expertise. This frees users to buy products that meet their specific needs.

For example, a manufacturer might build fixed-location radios (identified as base station or fixed station), in which case the product must meet the requirements of two P25 interfaces (both the CAI and the FSSI; described in the next bullet list). In addition, that manufacturer might offer non-standardized, value-added features as an extension to their P25 fixed radio offering, such as operation over large temperature spans (ideal for radios on mountaintop locations in isolated areas). Such a feature might be very important to a particular user. In another scenario, a manufacturer might highlight pricing considerations by offering a functionally limited fixed radio that still satisfies all of the mandatory P25 interface requirements. Again, this may be appealing to users for some applications.

The goal is to provide users the ability to choose from various manufacturers' offerings to build out their P25 systems. P25-compliant equipment offerings must satisfy all mandatory and, as applicable, optional requirements. (These requirements are noted as Mandatory and Standard Option features in *Project 25 Statement of Requirements (SOR)*. See [Section 3.1.](#)) This way, users can be confident that their P25 systems will work across the interface with other P25-compliant equipment regardless of manufacturer.

Following is a description of each P25 interface.

- **Common Air Interface (CAI)**
Enables wireless communication (voice and data) directly between P25 mobile and portable subscriber units (i.e., P25 radios) and between P25 mobile and portable subscriber units via a fixed/base station (and many times another radio, called a repeater, which is a component of the P25 equipment infrastructure).
- **Subscriber Data Peripheral Interface**
Enables data to be transferred between a P25 radio and an external data device directly connected to the P25 radio.
- **Fixed/Base Station Subsystem Interface (FSSI)**
Enables voice and control information to be transferred between an RF subsystem (RFSS) or console subsystem and a fixed/base station.
- **Console Subsystem Interface (CSSI)**
Enables voice and control information to be transferred between an RFSS and a console subsystem (a console is equipment that a dispatcher or a supervisor uses to oversee and control mission critical voice communications among field personnel).
- **Network Management Interface**
Enables administrators to comprehensively control and monitor P25 functional elements via RFSS connectivity.

- Data Network Interface
Enables data to be communicated to/from external computers, data networks, data sources, etc., via RFSS connectivity.
- Telephone Interconnect Interface
Enables field personnel to make connections through the public switched telephone network (PSTN) via RFSS connectivity by using their radios rather than, for example, using cellular telephones.
- Inter-RF Subsystem Interface (ISSI)
Enables different manufacturers' RFSS equipment to interoperate, and includes support for roaming of P25 radio subscribers among different jurisdictions, agencies, cities, etc.

2.2 Legend for P25 Standards Document Status

Tables in this reference guide identify the most current documents related to the P25 suite of standards. Tables list each document's title, document number, publication date, and a brief description of the document's purpose by summarizing the document's topics in parenthesis. [Section 3](#) lists the documents that describe the P25 user requirements and the P25 standards structure. Sections [4](#) through [6](#) list the documents related to the P25 interfaces, services, and equipment. The documents are listed under two major divisions:

- Description and Specification Documents
- Compliance Assessment Documents

One or more TIA-published documents are identified with each category of Overview, Protocol, Conformance Test Procedures, Measurement Methods, Performance Recommendations, and Interoperability Test Procedures. A category will list no documents if none are necessary or applicable, if none are planned, or if none are under development. See the “Document Status” section in [Table 1](#) for notation information.

Note: Yellow-highlighted documents are unpublished but are under development by the TR8 Committee. For each unpublished document, the TR8 Committee Chairs have supplied best-estimate target dates for release as an approved TR8 Committee document for publication and distribution by TIA. Be cautious of purchasing products without the benefit of published P25 standards.

P25 documents are freely available to Federal, state, and local public safety agencies. All others may purchase the documents from <http://global.ihs.com/> by searching for TIA and P25 documents.

The following legend provides document identifier conventions.

Table 1: Legend for P25 Standards

Item	Description
***-NNN.XXXX	
Where *** Can be:	ANSI/TIA/EIA — a full standard TIA — A TIA-only standard (the current objective is to move TIA standards to full ANSI standards) TSB — A TIA Telecommunications Systems Bulletin that is not a standard but is useful to P25-compliant equipment manufacturers and users
Where NNN can be:	102 — P25 Phase 1 and some Phase 2 standards 905 — P25 Phase 2 902 — P25 wide band services in the 700 MHz band 603 — Analog FM equipment
Where XXXX can be:	Axxx — Services offered by P25 Bxxx — Systems defined by P25 Cxxx — Equipment performance measurement methods for P25
Document Status	
No documents are currently under development	Documents might be planned, but are not yet under development
No documents are planned	Documents might be necessary, but are not yet planned
No documents are necessary or applicable	Currently, no documents are necessary or applicable

3 Project 25 User Requirements and Standards Structure

3.1 Project 25 Statement of Requirements

Public safety communication system users are responsible for providing and maintaining their user needs in the form of a system requirements document. The Steering Committee, with the involvement of its Project 25 User Needs Subcommittee (P25 UNS), establishes the priorities and scope for technical development by TIA of new and revised P25 standards.

The P25 UNS' ongoing development of the Project 25 Statement of Requirements (P25 SOR), as approved by the Steering Committee, plays an essential role in not only developing standards that meet users' needs but also to establish the basis upon which equipment and systems can be assessed as being compliant with the P25 standards. The P25 SOR also establishes a feasible migration path for P25 equipment and systems to take advantage of emerging technologies. As a result, the P25 SOR establishes a balance between user needs and what industry is able to implement based on current physical, technological, and regulatory constraints. [Table 2](#) lists current P25 SOR documents.

Table 2: Project 25 Statement of Requirements Documents

Documents
<ul style="list-style-type: none"> ■ <i>Project 25 Statement of Requirements (SOR)</i>, (Aug 2007) (Project 25 Overview, Detailed Standards Suite Proposed [Common Air Interface, Data Interface, Inter-RF Subsystem Interface, Network Management Interface, Open Console Interface, and Open Fixed/Base Station Interface], P25 System Overview, Encryption, Subscriber Equipment, Interoperability, Migration) This document is available from your web browser at: ftp://ftp.tiaonline.org/TR-8/APIC/P25 UNS/Current Approved Project 25 Statement of Requirements/

3.2 Project 25 System Description and Organization

P25 system overview documents describe how the users and manufacturers envision the P25 system, the logical interfaces and services the standards will specify, and the documents needed to completely characterize the P25 Standards Suite. Project 25 provides this information in TSB overview documents (sometimes referred to as “shell” documents). These documents provide an overview of the entire suite of standards for all interfaces and give a functional description for the current set of Common Air Interface features. (Note that the P25 documents suite contains overviews of individual interfaces and services, as well.) The current documents are listed in [Table 3](#).

Table 3: Project 25 System Description and Organization Documents

Documents
<ul style="list-style-type: none"> ■ <i>Project 25 System Description and Organization</i>, TSB-102A (Nov 1995) (Project 25 Overview, General System Model, Standards Organization, and Technical Requirements)

4 Suite of Standards for Project 25 Interfaces and Systems

This section discusses the suite of standards documents for the (currently) eight interfaces of a P25 system. (See [Section 2](#) for a description of each how each interface fits in a P25 system.) For each of the interfaces, a table is provided to identify the documents that have been approved by TIA for publication. Once in publication, the documents are to be used by manufacturers to design, develop, and offer products to the public safety community that meet the P25 system standards. Similarly, public safety users can identify the TIA-published documents in their request for proposals (RFPs) of P25 systems to ensure that the products to be purchased are associated with the approved P25 standards.

4.1 Common Air Interface

The P25 Common Air Interface (CAI) uses frequency division multiple access (FDMA) methods with two modulations. The first defines the digital modulation used in the 12.5 kHz voice channel bandwidth and is mandatory for all P25 Phase 1 systems. The second defines the analog FM modulation used in 25 kHz and 12.5 kHz bandwidths and is mandatory in all P25 Phase 1 subscriber equipment (portable and mobile transceivers). Operation in a conventional mode is mandatory for P25 and operation using trunking is optional. The P25 structure defines trunking as a service. [Section 5.2](#) lists trunking related documents.

4.1.1 FDMA Conventional Digital—Phase 1

Mandatory The following documents provide guidance necessary to meet the mandatory P25 FDMA conventional digital standard for Phase 1. ([Section 1.1.2](#) describes Phase 1.)

Table 4: FDMA Conventional Digital Documents—Phase 1

4.1.2 FDMA Conventional Analog—Phase 1

Mandatory FDMA conventional analog capabilities are mandatory for P25 Phase 1 subscriber equipment to provide backward compatibility with non-P25 systems. [Section 6.1](#) lists the documents associated with this P25 equipment feature.

4.1.3 FDMA Trunked Digital—Phase 1

Optional Support for FDMA trunked digital capabilities is optional (mandatory if supporting FDMA Trunked Digital features) for Phase 1 P25 systems. [Section 5.2.1](#) lists the documents associated with this P25 services feature.

4.1.4 TDMA Trunked Digital—Phase 2

Optional Support for Time division multiple access (TDMA) trunked digital capabilities is optional (mandatory if supporting TDMA Trunked Digital features) for Phase 2 P25 systems. [Section 5.2.2](#) lists the documents associated with this P25 services feature.

4.1.5 Vocoder

Mandatory The following documents provide guidance necessary to meet the mandatory P25 system voice services vocoder standard.

Table 5: Vocoder Documents

Document Type	Documents
Description and Specification Documents

4.2 Inter-RF Subsystem Interface

Table 7 and Table 8 list current Scope 1 and Scope 2 P25 Inter-RF Subsystem Interface (ISSI) description, specification, and assessment documents.

4.2.1 Scope 1 – Voice Services

Optional The following documents provide guidance necessary to meet the optional (mandatory if supporting RFSS) Scope 1 P25 protocol standards defining ISSI support of P25 trunked voice service among multi-jurisdictional systems. This includes support for roaming subscriber equipment, with the following objectives:

- Mobility management
- Call control
- Push-to-talk management

Table 7: Inter-RF Subsystem Interface Documents, Scope 1 – Voice Services

4.2.2 Scope 2 – Additional Project 25 Services

Optional

The following documents provide guidance necessary to meet the optional (mandatory if supporting RFSS) Scope 2 P25 protocol standards defining ISSI support of four additional P25 services among multi-jurisdictional systems:

- P25 supplementary data service (e.g., call alert)
- P25 packet data on the Data Network Interface (including Over-The-Air-Rekeying (OTAR))
- ISSI support of the P25 Console Subsystem Interface (CSSI)
- P25 conventional voice service (including mixed trunked/conventional voice service)

5 Suite of Standards for Project 25 Services

This section discusses the suite of standards documents for the (currently) two services of a P25 system. For each of the services, a table is provided to identify the documents that have been approved by TIA for publication. Once in publication, the documents are to be used by manufacturers to design, develop, and offer products to the public safety community that meet the P25 system standards. Similarly, public safety users can identify the TIA-published documents in their RFPs of P25 systems to ensure that the products to be purchased are associated with the approved P25 standards.

Project 25 currently has two broad categories of services. The first deals with encryption for security of voice and data as well as security of radio control channels, etc. The second deals with trunking of radio channels to promote spectrum efficiency.

5.1 Encryption Services

Several encryption algorithms are available for use with P25 systems. The oldest algorithm, for which there are P25 standards documents, is Data Encryption Standard (DES). This particular algorithm is no longer endorsed (after May 2005) by the Federal Government for secure communications. The most recently endorsed algorithm is Advanced Encryption Standard (AES) and must be used by all Federal agency communications systems beyond May 2007. The recommendation has been that State and local agencies also transition to AES to ensure interoperability.

The following subsections define the two algorithms and their use, a standard key fill device to manually load encryption keys into P25 radios, and a standard over-the-air-rekeying (OTAR) procedure to automatically rekey P25 radios.

Encryption is an option for P25 systems but when it is desired, the following standards apply.

5.1.1 Advanced Encryption Standard

Optional The following documents provide guidance necessary to meet the optional (mandatory if supporting AES features) P25 standard for advanced encryption.

Table 15: Encryption – Advanced Encryption Standard Documents

Document Type	Documents

5.2 Trunked Services

Project 25 allows an option to use trunking to increase radio system efficiencies. One trunking scheme uses the radio channels in a frequency division multiple access (FDMA) mode. A second scheme uses the FDMA traffic channels in a time division multiple access (TDMA) mode to further increase the spectrum efficiencies. The two schemes are defined below.

5.2.1 FDMA Trunked Digital—Phase 1

Optional The following documents provide guidance necessary to meet the optional (mandatory if supporting FDMA Trunked Digital features) Phase 1 P25 FDMA Trunked Digital standard. (Section 1.1.2 describes Phase 1.)

Table 19: FDMA Trunked Digital Documents—Phase 1

6 Suite of Standards for Project 25 Equipment

This section discusses the suite of standards documents for the (currently) five equipment types of a P25 system. For each of the equipment types, a table is provided to identify the documents that have been approved by TIA for publication. Once in publication, the documents are to be used by manufacturers to design, develop, and offer products to the public safety community that meet the P25 system standards. Similarly, public safety users can identify the TIA-published documents in their RFPs of P25 systems to ensure that the products to be purchased are associated with the approved P25 standards.

P25 radio equipment must meet certain performance standards set by spectrum regulators and by P25 system designers to ensure the radio equipment will behave predictably and act as good neighbors with nearby systems. The required performance will depend upon the modulation and access method used by the system. Further, the P25 radio equipment is expected to meet standards for audio tones and audio interfaces. The next sections relate to the various configurations.

6.1 Analog FM Transceivers—Phase 1

Mandatory The following documents provide guidance necessary to meet the mandatory P25 Phase 1 Analog FM Transceiver standard, which provides backward compatibility with non-P25 radio systems. (Section 1.1.2 describes Phase 1.)

Table 21: Analog FM Transceiver Documents—Phase 1

7 Project 25 Decision Charts

Use the decision charts in this section to find the P25 standards relevant to a given public safety communications component.

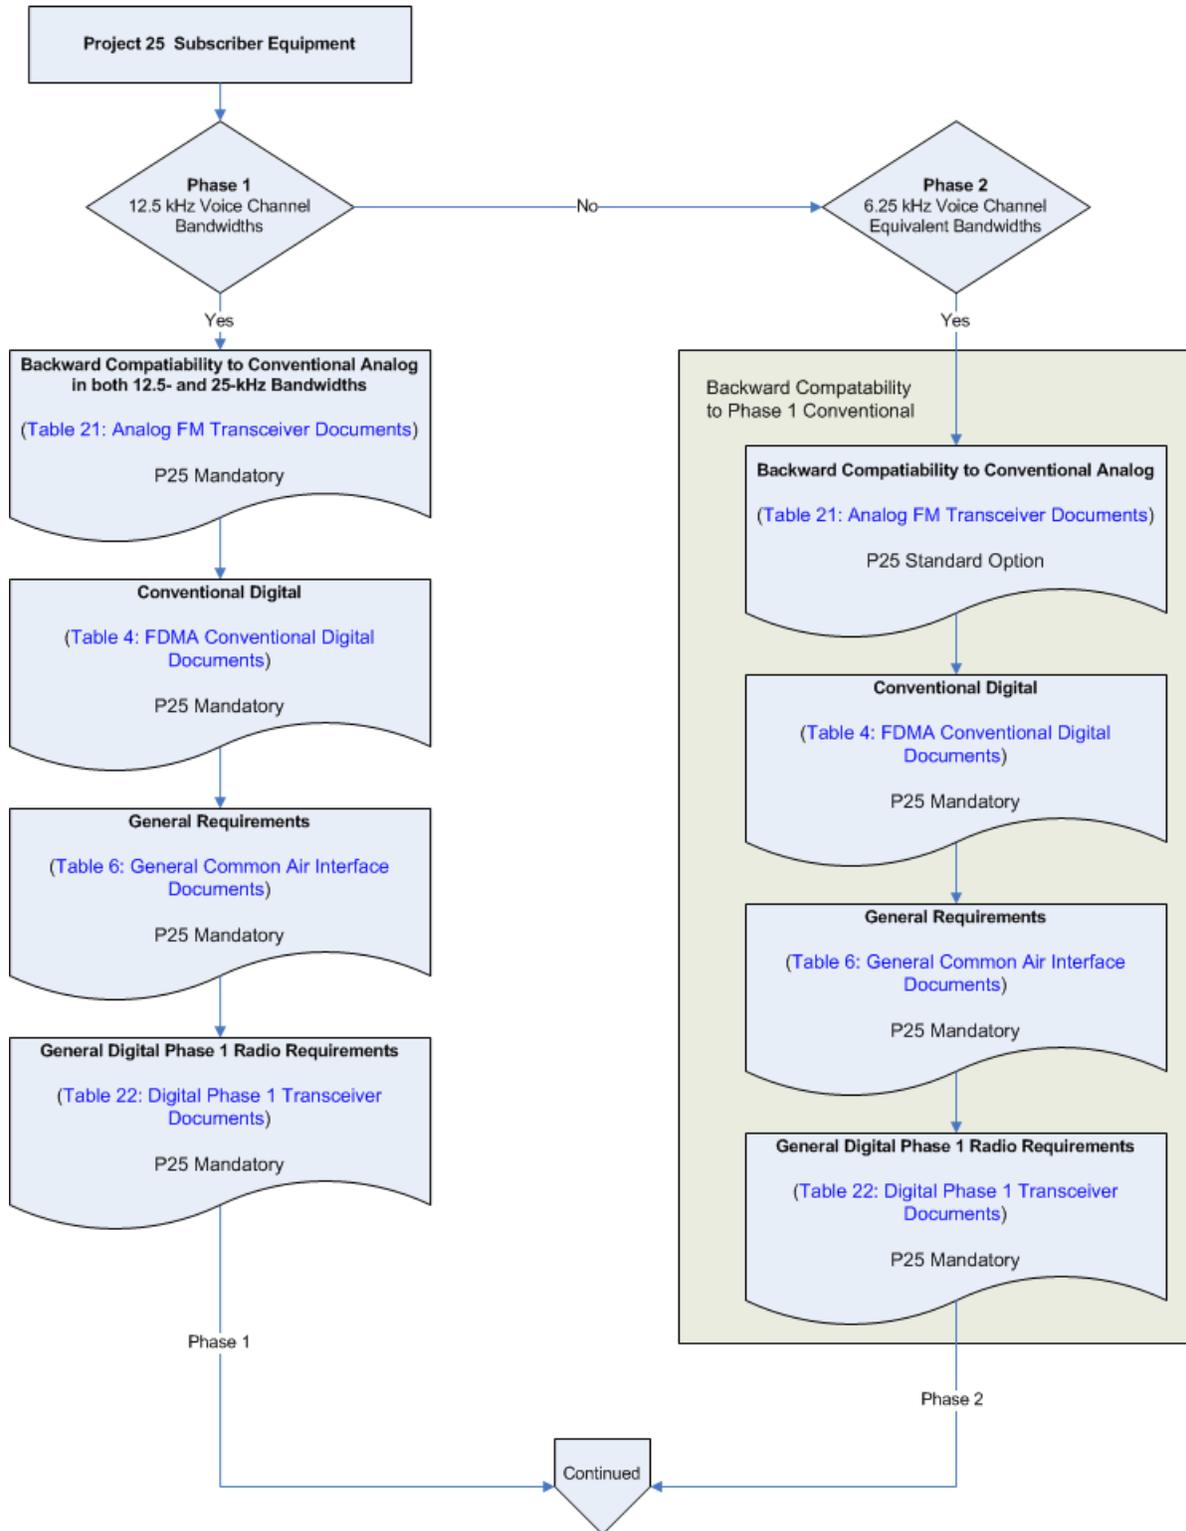

The P25 decision charts span over the next several pages. Graphical arrows denote a break to the next page or a continuation from the previous page.

Note: In the decision charts, click a table's title to jump to that table in this document.

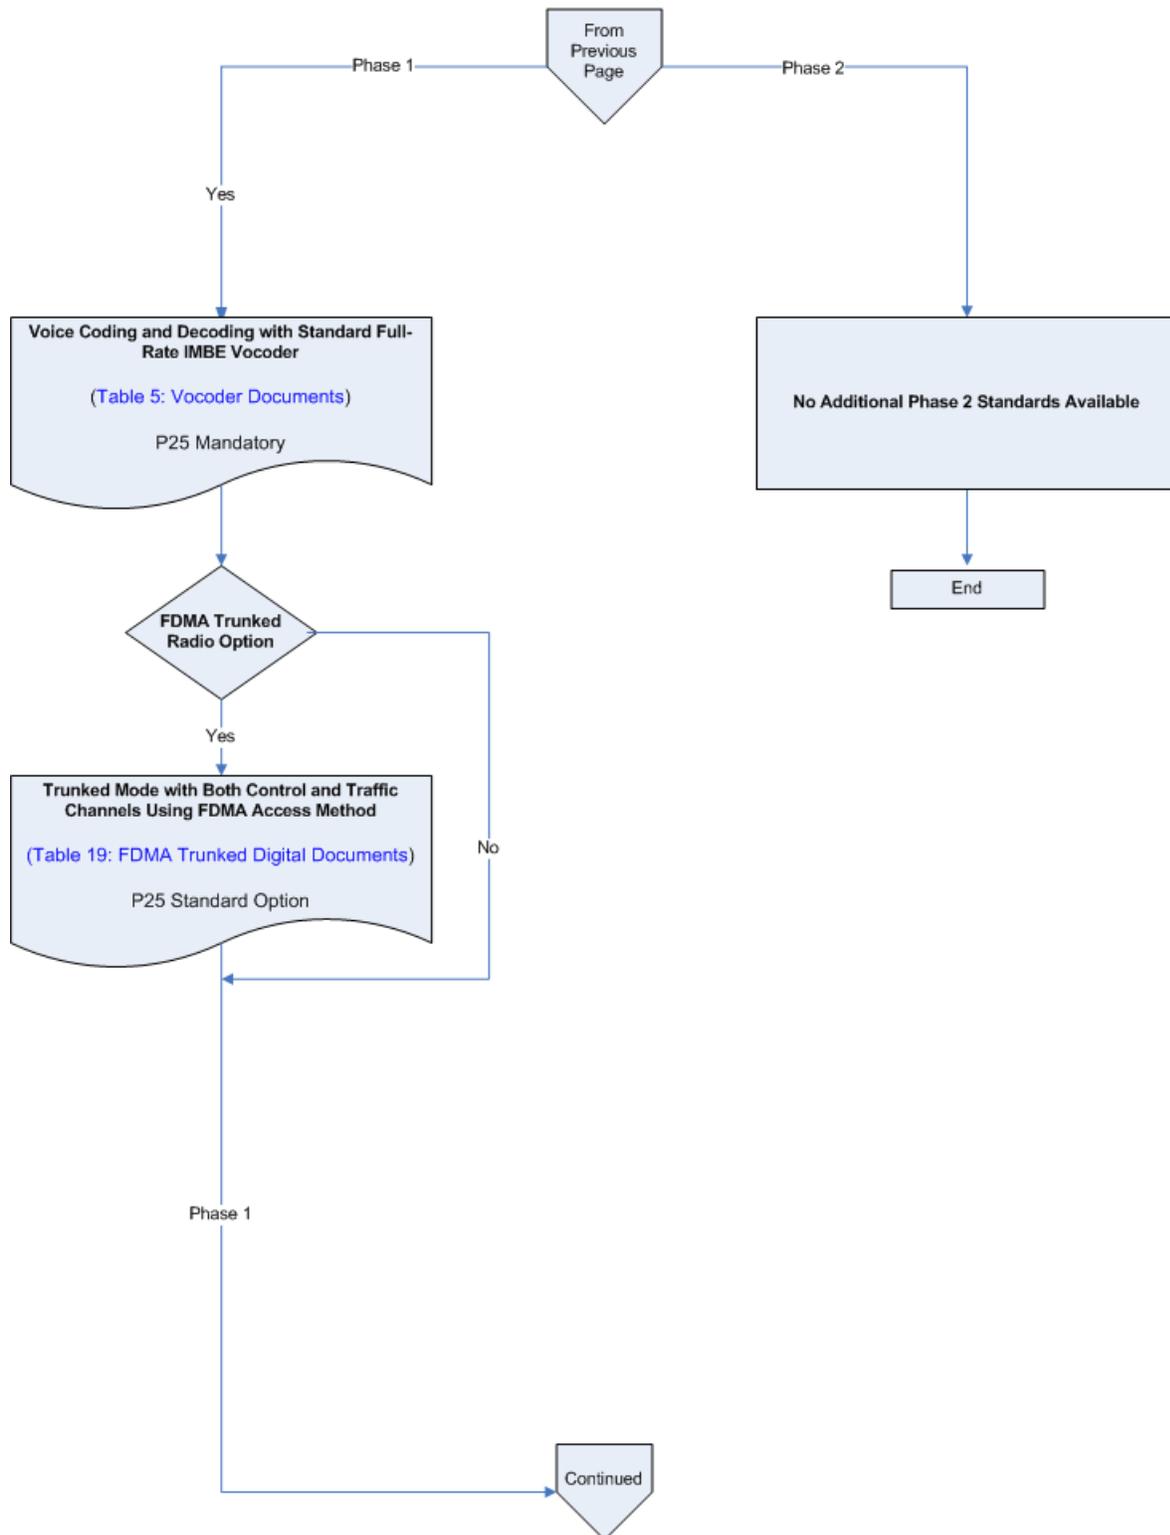

See [Section 2.2, “Legend for P25 Standards Document Status,”](#) on [page 7](#) for information about the identifier convention used for document names.
